

Hanging Platform Access System

A safe, modular, working platform system, that can be quickly installed around the outer perimeter of structures, allowing high access without restricting the area below. Often used in places where floor mounted scaffold would impede other activities or would not be cost effective.

Lightweight system comprising of a console, which is suspended or attached to the structure using a range of supports, into which a boardwalk and guardrail are fitted to create a walkway.

The relatively small components also make this system suitable for installations in difficult access areas such as bridges and viaducts.

Features and Benefits

- Tested and approved in accordance to AFS 1990:12 and SS-EN 12711-1
- Guardrail, toeboard and work platform all in one system
- Creates working platform around edges of structures and is designed to fit many building shapes
- Adjustable in height
- Pre assembled on the ground
- Restricts unauthorised access thus improving site security
- The heaviest single item weighs only 25kg

"The target for the whole economy is to reduce the rate of fatal and major injury to workers by 10% by 2009/10"
